# 1 Programming Overview

The SSG5000X Series Signal Generator supports USB, LAN and USB-GPIB interfaces. Through these interfaces, combined with NI-VISA and corresponding programming language, users can use the command set based on SCPI (Standard Commands for Programmable Instruments) to remotely program and control the instrument, and interact with other programmable instruments that support the SCPI command set.

Through the LAN interface, VXI-11, Sockets, and Telnet protocols can be used to communicate with the instrument.

This chapter describes how to establish communication between the signal generator and the computer, and how to remotely control the signal generator.

## 1.1 Build communication via VISA

### 1.1.1 Install NI-VISA

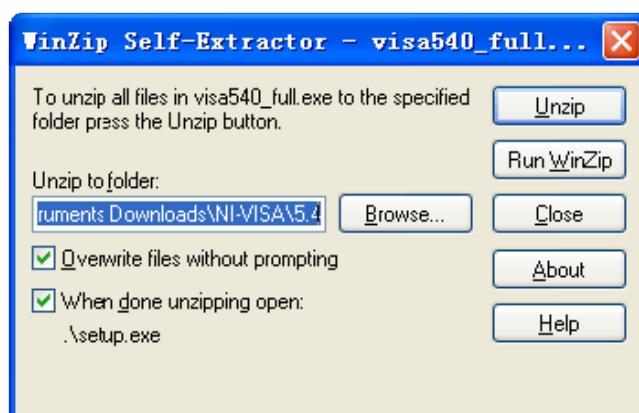

Before programming, please make sure that you have properly installed the latest version of National Instruments NI-VISA Software.

NI-VISA is a communication library for communication between computers and devices. NI software has two valid VISA installation packages: full version and run-time engine version (Run-Time Engine). The runtime engine version provides NI device drivers such as USB-TMC, VXI and GPIB, etc. It is mainly used for remote control. The full version includes the runtime engine and NI MAX tools, where NI MAX is the user interface for controlling the device.

You can download the latest NI-VISA runtime engine or full version from the NI official website. Their installation steps are basically the same.

Please refer to the following steps to install NI-VISA (the example uses the full version of NI-VISA5.4):

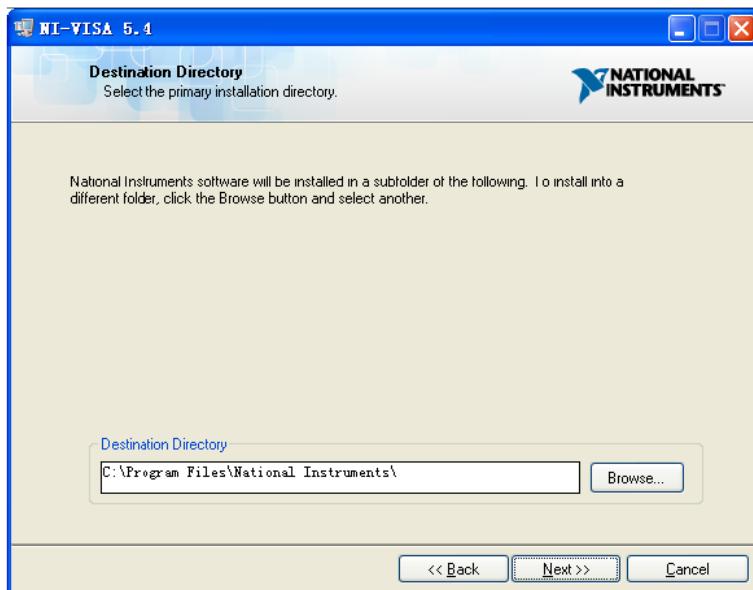

- Download the appropriate version of NI-VISA.
- Double-click visa540\_full.exe, and the dialog box will pop up as follows:

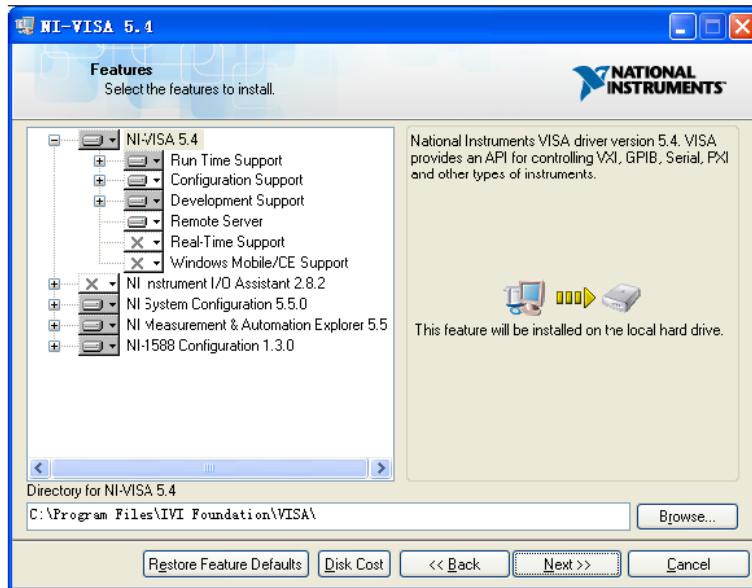

- c. Click Unzip. Then the installation process will launch automatically after unzipping files. If your computer needs to install the .NET Framework 4, it shall auto-start.

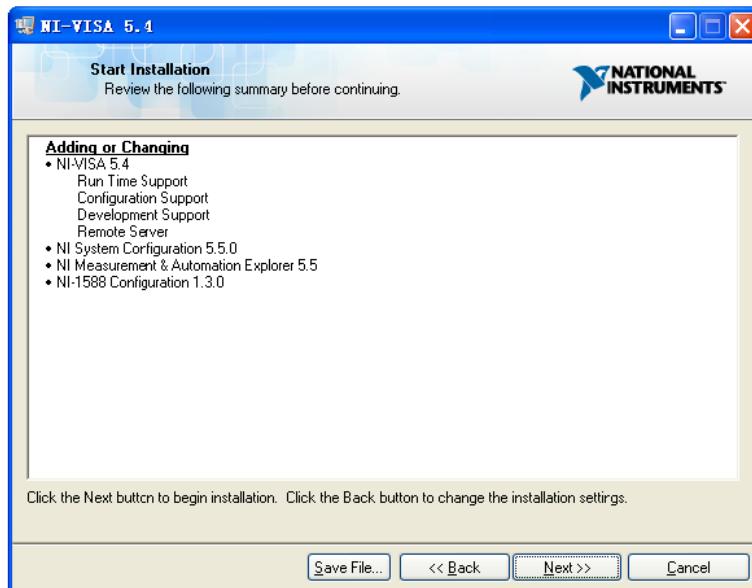

- d. The NI-VISA install dialog is shown above. Click Next to start the installation process.

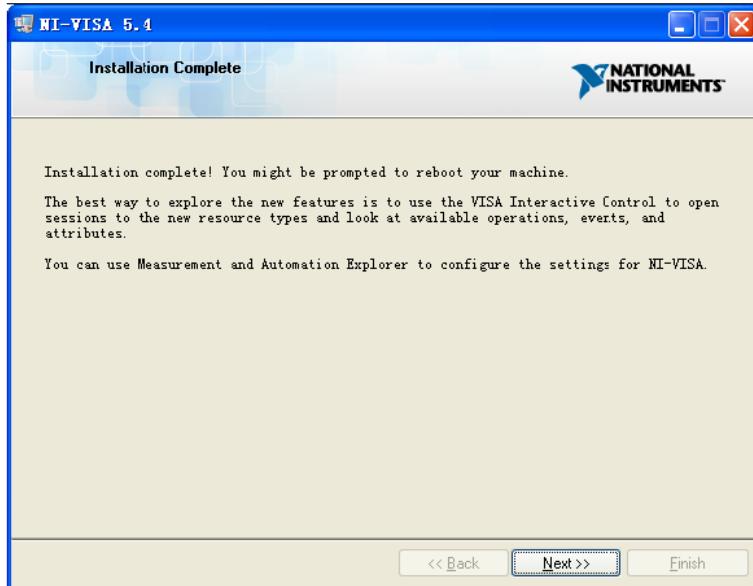

- e. Set the installation path. The default path is "C:\Program Files\National Instruments\". You can also modify the installation path. Click Next and the dialog box will appear as shown below.

- f. Click Next twice. In the License Agreement dialog, select “I accept the above 2 License Agreement(s).” and click Next. The dialog box will appear as shown below:

- g. Click Next to begin installation.

- h. Now the installation is complete. Reboot your computer.

## 1.1.2 Connect the instrument to computer

The signal generator may be able to communicate with the computer through the USB, LAN or USB-GPIB interface.

### 1.1.2.1 Connect using USB interface

Please refer to the following steps to finish the connection via the USB interface:

1. Install NI-VISA on your computer to obtain the USB-TMC driver.
2. Connect the USB Device interface of the signal generator to the USB Host interface of the computer with a USB A-B cable.
3. Turn on the signal generator.

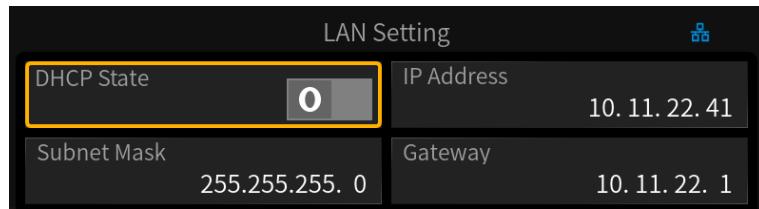

The signal generator will be automatically detected as a new USB device.

### 1.1.2.2 Connect using LAN interface

Please refer to the following steps to finish the connection via the LAN interface:

1. Install NI-VISA on your computer to obtain the VXI driver.
2. Use a network cable to connect the signal generator to your computer or the local area network.
3. Turn on the signal generator.
4. Press **UTILITY** → Interface to enter the LAN Setting menu.
5. Set the LAN as Static or DHCP:
  - ◆ **DHCP:** The DHCP server in the current network will automatically assign network parameters (IP address, subnet mask, gateway) to the signal generator.

- ◆ Static: You can manually set the IP address, subnet mask, and gateway.

The signal generator will be automatically or manually detected as a new LAN device.

#### 1.1.2.3 Connect using USB Host interface (With USB-GPIB Adaptor)

Please refer to the following steps to finish the connection via the LAN interface:

1. Install the NI-VISA GPIB driver on the computer.
2. Use the SIGLENT USB-GPIB adapter to connect the USB Host interface of the signal generator to the GPIB interface of the computer.

3. Turn on the signal generator.
4. Press **UTILITY** → Interface and enter the GPIB number in GPIB Address.

The signal generator will be automatically detected as a new GPIB device.

## 1.2 Remote Control

### 1.2.1 User-defined Programming

Users can send SCPI commands through the computer to program and control the signal generator. For details, please refer to the introduction in the “Programming Examples” chapter.

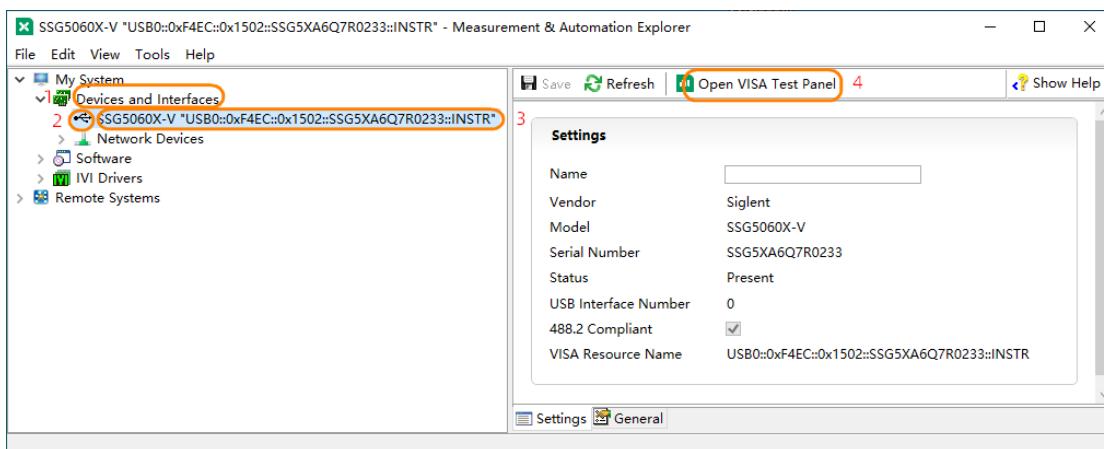

### 1.2.2 Send SCPI via NI-MAX

NI-MAX is a program created and maintained by National Instruments. It provides basic remote-control interfaces for VXI, LAN, USB, GPIB, and Serial communications. Users can send SCPI commands through NI-MAX to remotely control the signal generator.

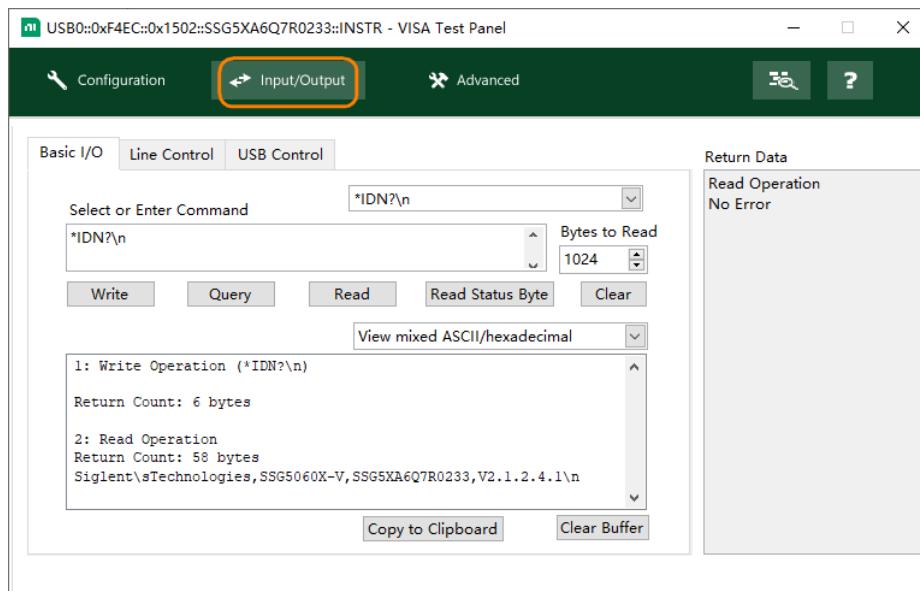

The following describes the steps for connecting a device through a USB, LAN, or GPIB interface in NI-MAX and sending SCPI to the device.

#### 1.2.2.1 Using USB

1. Run NI-MAX.
2. Click “Devices and Interfaces” in the upper left corner of the software.
3. Find the USBTMC device symbol:  .
4. Select the signal generator device and click the “Open VISA Test Panel” button.

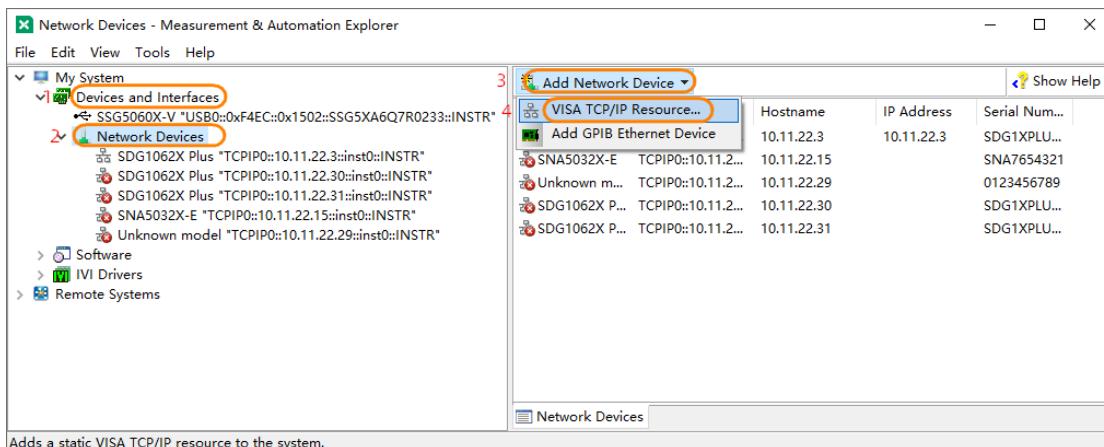

5. Select the “Input/Output” page in the VISA test panel. At this time, you can enter SCPI in the input field to write or query. Click the “Query” button as shown below to query the device’s IDN:

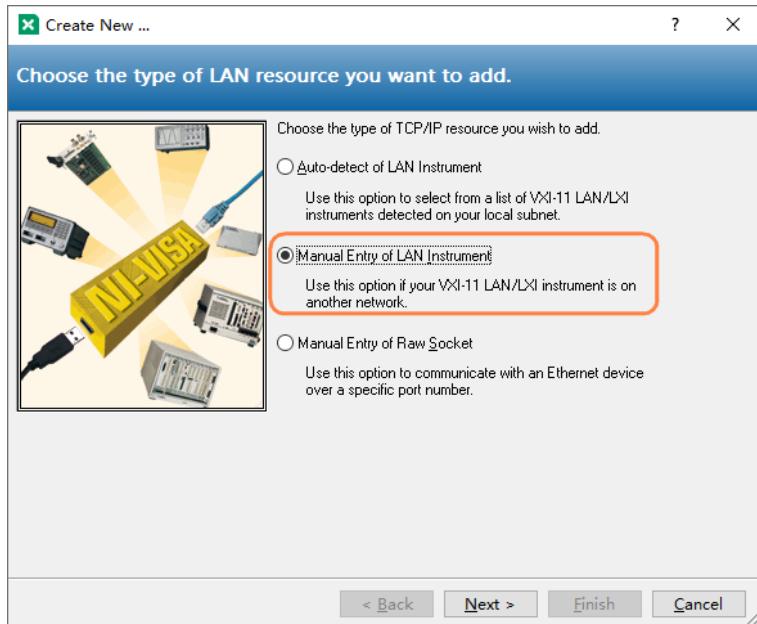

### 1.2.2.2 Using LAN

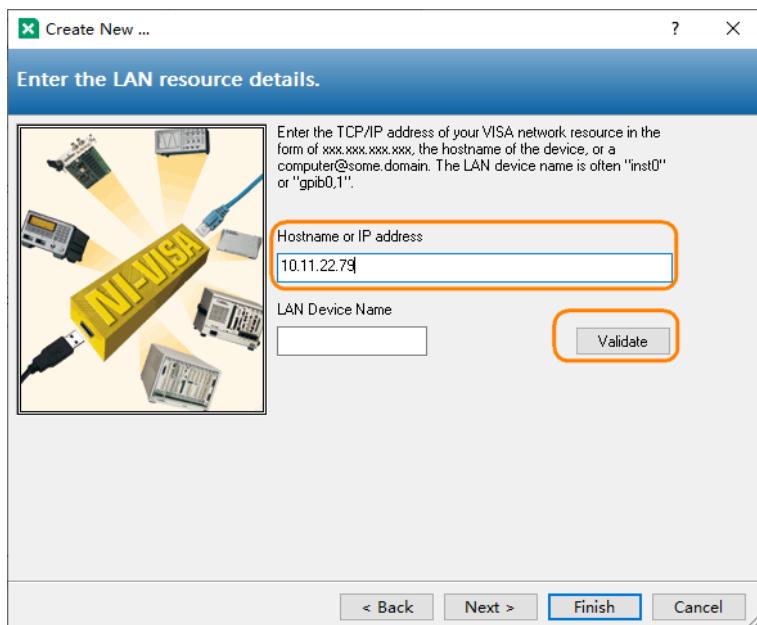

1. Run NI-MAX.
2. Click “Devices and Interfaces” > “Network Devices” in the upper left corner of the software.
3. Click “Add Network Device” > “VISA TCP/IP Resource...”.

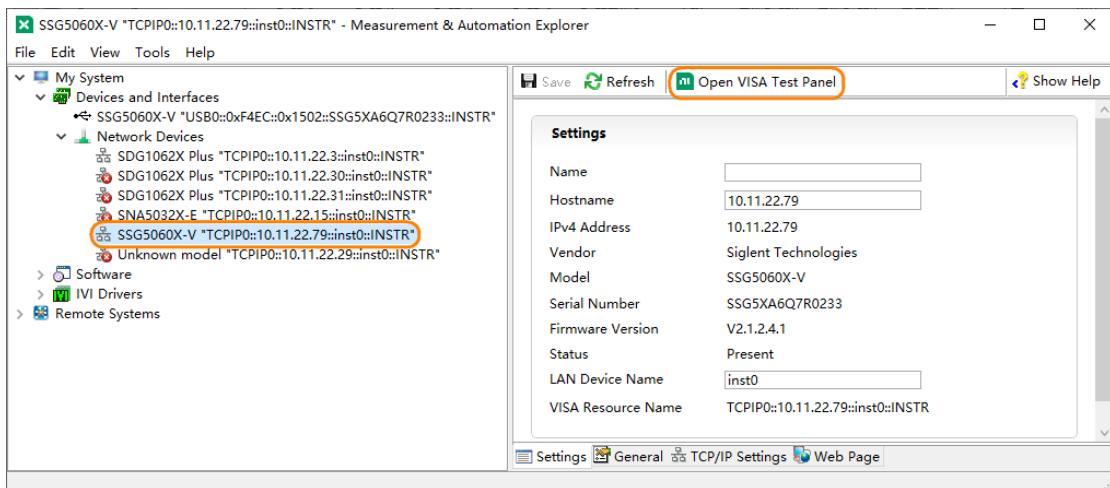

4. In the pop-up “Create New...” window, select “Manual Entry of LAN Instrument” and then click Next.

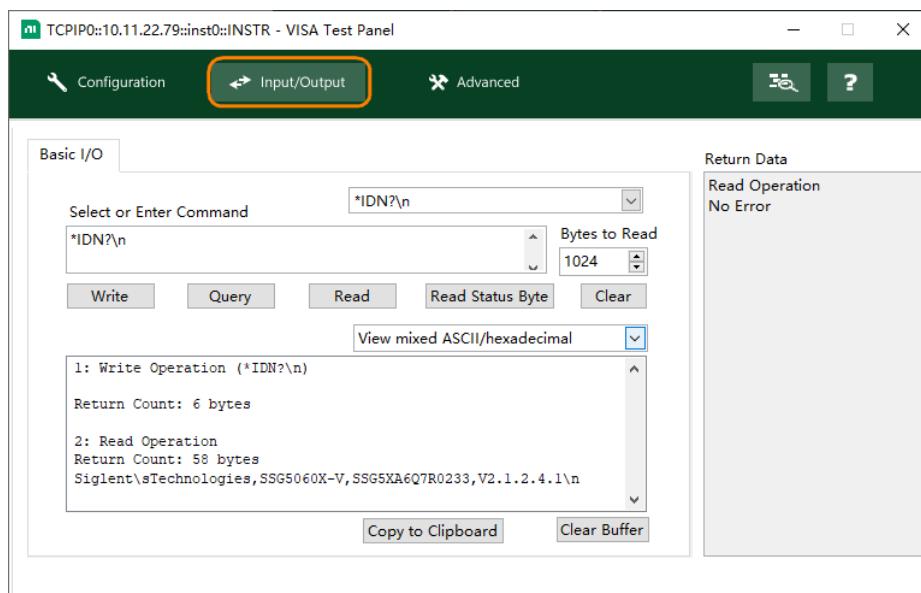

- Enter the IP address of the signal generator in "Hostname or IP address". You can click "Validate" to verify whether the device can be connected via the entered IP.

- Click "Finish" to establish the connection.
- After a short scan, the resource name of the signal generator should be displayed under "Network Devices".

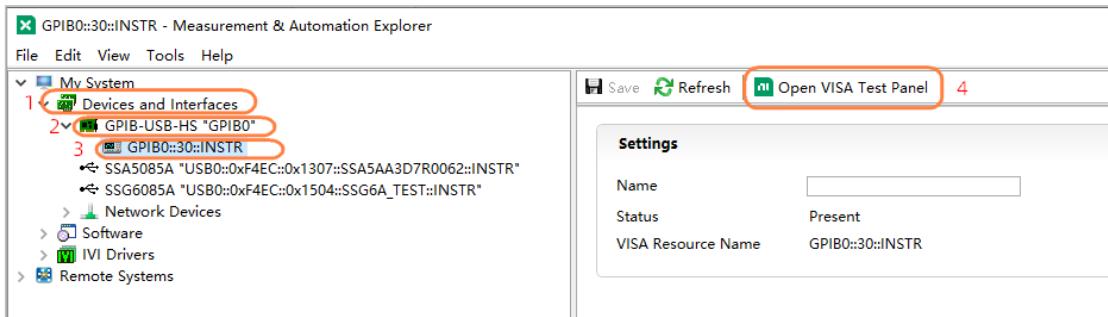

8. Select the signal generator device and click the “Open VISA Test Panel” button.
9. Select the “Input/Output” page in the VISA test panel. At this time, you can enter SCPI in the input field to write or query. Click the “Query” button as shown below to query the device’s IDN:

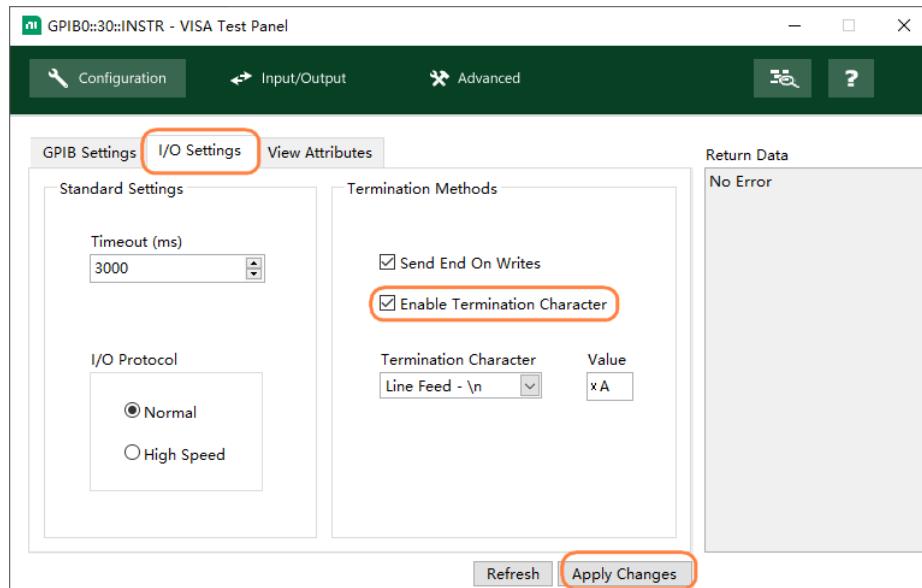

### 1.2.2.3 Using USB-GPIB

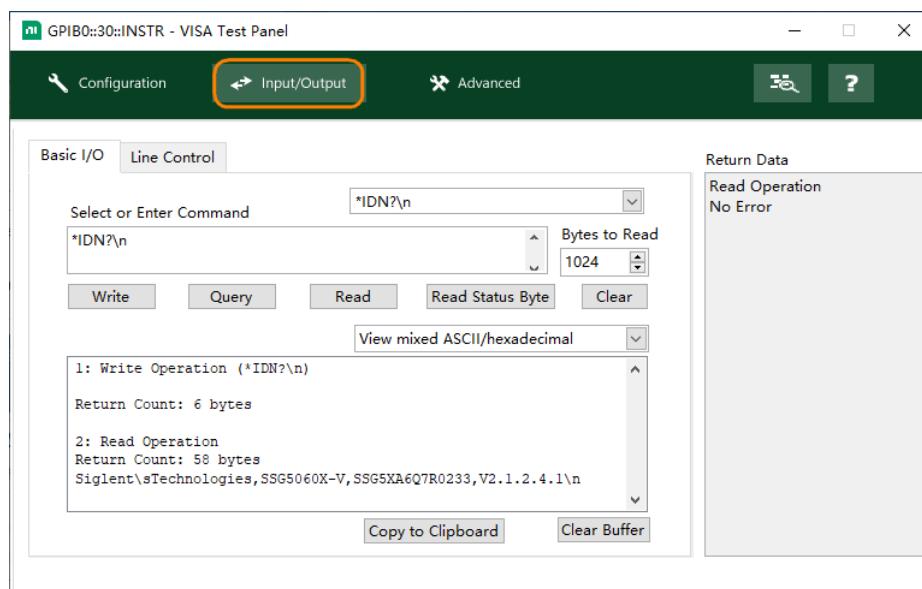

1. Run NI-MAX.
2. Click “Devices and Interfaces” in the upper left corner of the software.
3. Find the “GPIB-USB-HS” device symbol.
4. Select the signal generator device and click the “Open VISA Test Panel” button.

5. Select the “Configuration” > “I/O Settings” in the VISA test panel. Check the Enable Termination Character option, and click Apply Changes button.

6. Select the “Input/Output” page in the VISA test panel. At this time, you can enter SCPI in the input field to write or query. Click the “Query” button as shown below to query the device’s IDN:

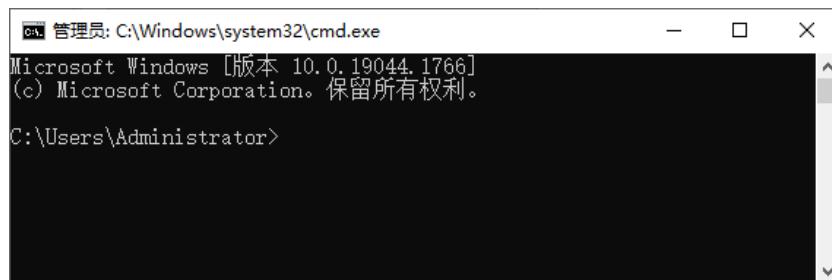

### 1.2.3 Send SCPI over Telnet

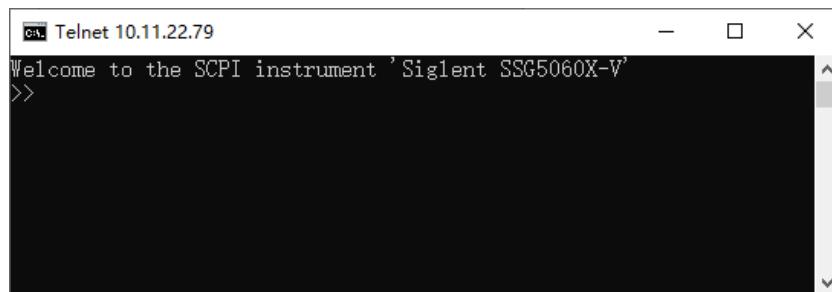

Telnet provides a way to communicate with the signal generator through the LAN interface. The Telnet protocol supports sending SCPI commands from the computer to the signal generator in a manner similar to communicating with the signal generator via USB. Sending and receiving information is interactive, and only one command can be sent at a time. Windows operating systems use a command prompt style interface as a Telnet client.

The steps are as follows:

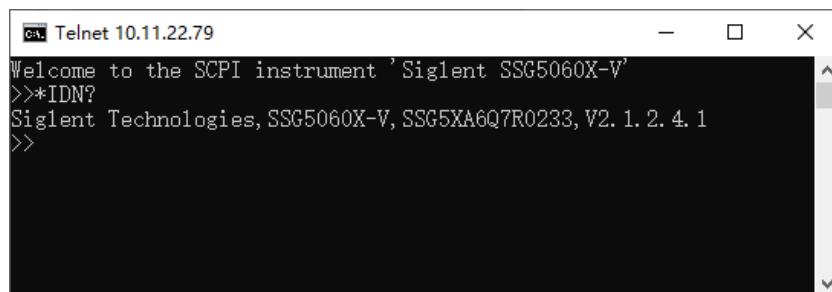

1. On the computer desktop, click Start, then right-click and select Run. Enter *cmd* in the run window and click OK. The command prompt window opens.

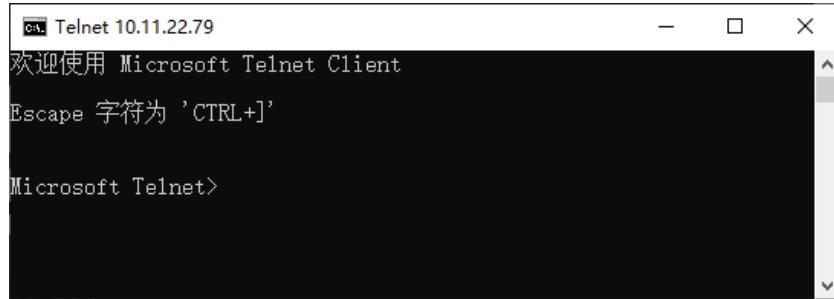

2. In the command prompt window, enter *telnet <IP address> 5024* and press Enter. A Telnet window that can communicate with the instrument will pop up:

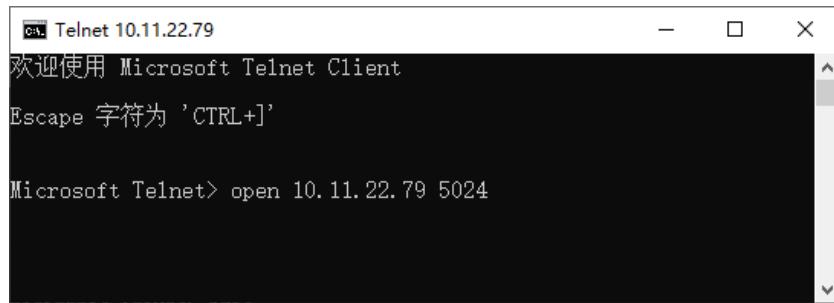

3. After the ">>" prompt, you can enter a SCPI command to remotely control the signal generator. For example, enter *\*IDN?*, this command will return the company name, machine model, serial number and firmware version number.

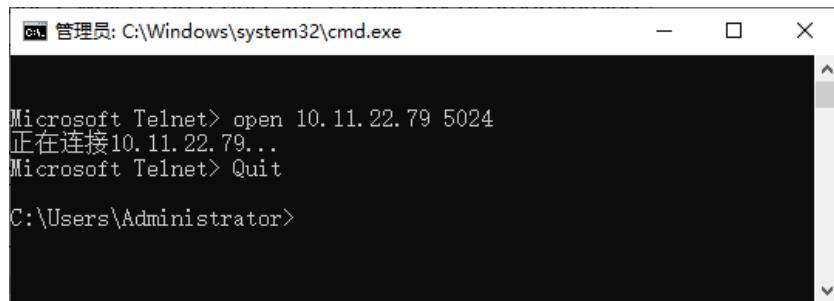

4. Press **Ctrl+]** keys simultaneously to exit the SCPI session with the instrument.

5. To re-enter the SCPI session with the instrument, you can enter `open <IP Address> 5024` and press Enter.

6. To close the Telnet window, type `Quit` and press Enter.

#### 1.2.4 Send SCPI over Socket

Socket API can be used to control the signal generator through the LAN interface without installing any other libraries, which can reduce the complexity of programming.

For detailed information, please refer to the “Socket Examples” chapter of “Programming Examples”.

<b>SOCKET ADDRESS</b>	IP address + port number
<b>IP ADDRESS</b>	SSG IP address
<b>PORT NUMBER</b>	5025

## 2 Introduction to the SCPI Language

### 2.1 Command Format

SCPI commands are tree-like hierarchical structures, including multiple subsystems. Each subsystem consists of a root keyword and one or several hierarchical keywords. The command line usually starts with a colon ":" and keywords are separated by a colon ":". The keyword is followed by optional parameter settings. The command and parameters are separated by "space". For multiple parameters, the parameters are separated by commas ",". Add a question mark "?" after the command line to indicate querying this function.

For example:

```
:SOURce:FREQuency <freq>  
:SOURce:FREQuency?
```

SOURce is the root keyword of the command, and FREQuency is the second-level keyword. The command line starts with a colon ":", and colons separate keywords at each level. <freq> represents a settable parameter. The command: SOURce:FREQuency and the parameter <freq> are separated by a "space". The question mark "?" indicates query, and the instrument will return a response string after receiving the query command.

### 2.2 Symbol Instruction

The following are the symbols used in the SCPI commands:

#### 1. Angular brackets < >

The contents in angular brackets < > are command parameters and must be replaced with a valid value. For example:

POWeR:SPC:TARGet <power> command, you can send as POWeR:SPC:TARGet 0.

#### 2. Square brackets [ ]

Contents in square brackets (command keywords or default parameters) can be omitted. If you omit the keyword in square brackets, the command still produces the same effect. If a default parameter in square brackets is omitted, the default parameter still takes effect.

#### 3. Vertical lines |

Vertical bars are used to separate multiple enumeration values, one of which must be selected when sending a command. For example:

In the [:SOURce]:AM:STATe OFF|ON|0|1 command, the optional command parameters are "OFF", "ON", "0" or "1".

#### 4. Braces {}

Parameters in braces are optional and may not be set, or may be set once or multiple times. For example:

In the :CALCulate:LLINe[1]|2:DATA <x-axis>,<ampl>{,<x-axis>,<ampl>} command, {<x-axis>,<ampl>} in braces can be omitted, or one or more pairs of frequency and amplitude parameters can be set.

## 2.3 Parameter Type

The parameters in the commands introduced in this manual include 6 types: Boolean, enumeration, integer, float, string and discrete.

### 1. Boolean

The parameter in the command could be "OFF", "ON", "0" or "1".

For example:

[:SOURce]:FM:STATe OFF|ON|0|1

### 2. Enumeration

Parameter should be one of the listed values.

For example:

In [:SOURce]:SWEep:STATe OFF|FREQuency|LEVel|LEV\_FREQ command, valid parameters are "OFF", "FREQuency", "LEVel" or "LEV\_FREQ".

### 3. Integer

Unless otherwise stated, the parameter can be any integer within the valid value range.

For example:

In [:SOURce]:SWEep:STEP:POINts <value> command, the parameter <value> can be set to any integer between 2 and 65535.

### 4. Float

Parameters can take any value within the valid range according to accuracy requirements (usually the default accuracy is nine decimal places).

For example:

In [:SOURce]:POWer:OFFSet <value> command, the parameter <value> can be set to any real number between -100 and 100.

## 5. String

The parameter should be the combination of ASCII characters.

For example:

In :SYSTem:COMMunicate:LAN:IPADDress <“xxx.xxx.xxx.xxx”> command, the IP address can be set as the string “192.168.1.12”.

## 6. Discrete

The parameter could only be one of the specified values and these values are discontinuous.

For example:

In [:SENSe]:BWIDth:VIDeo:RATio <number> command, the parameter <number> could only be one of 0.001, 0.003, 0.01, 0.03, 0.1, 0.3, 1.0, 3.0, 10.0, 30.0, 100.0, 300.0, 1000.0.

## 2.4 Command Abbreviation

All SCPI commands are case-insensitive. You can enter the complete command in all uppercase or all lowercase. You can also use abbreviations, in which case the abbreviated command must contain all uppercase letters in the command format.

For example:

:CORRection:FLATness:COUNt?

You can send in any of the following writing methods:

:CORRection:FLATness:COUNt?

:CORRECTION:FLATNESS:COUNT?

:correction:flatness:count?

You can also abbreviate it to:

:CORR:FLAT:COUN?

## 4 Programming Examples

This chapter provides some examples for programmers. In these examples you can see how to use VISA or Sockets and the above SCPI commands to control a signal generator. By following these examples, you can develop more applications.

### 4.1 VISA Examples

#### 4.1.1 VC++ Example

**System environment:** Windows 10, 64-bit operating system

**Programming software:** Visual Studio

**Example content:** Use NI-VISA to access and control the device through USBTMC or TCP/IP and perform read and write operations.

Please follow below steps to complete the example:

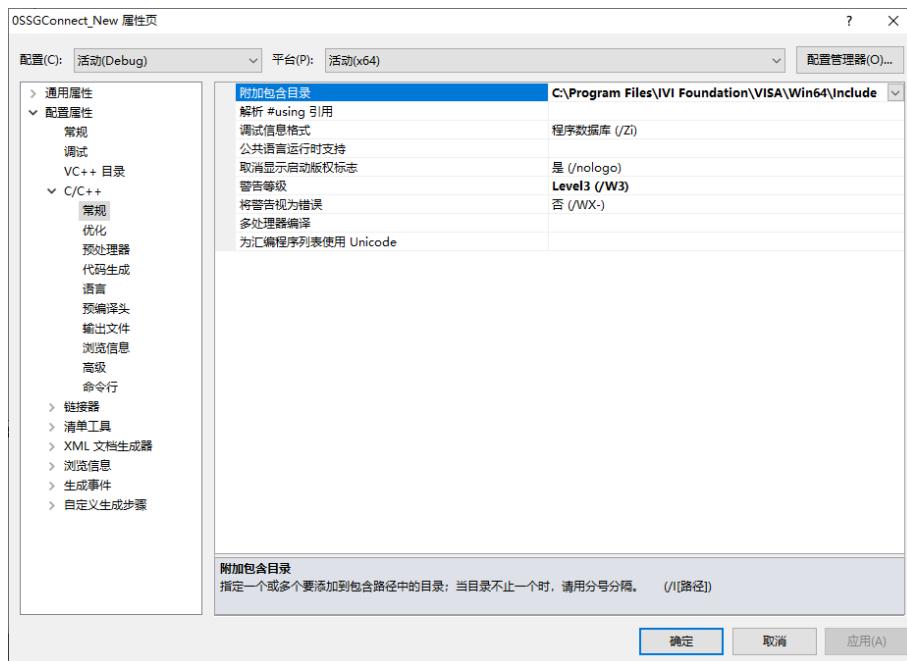

1. Open Visual Studio, and create a new VC++ win32 console project.
2. Set up the project environment to use the NI-VISA library. There are two ways to use the NI-VISA library, static or automatic:
  - (1) Static:

Find the files in the NI-VISA installation path: visa.h, visatype.h, visa32.lib. The default installation path of NI-VISA is “C:\Program Files\IVI Foundation\VISA\Win64”. Copy the above files into your project and add them to the project. Then add the following two lines of code in the project.cpp file:

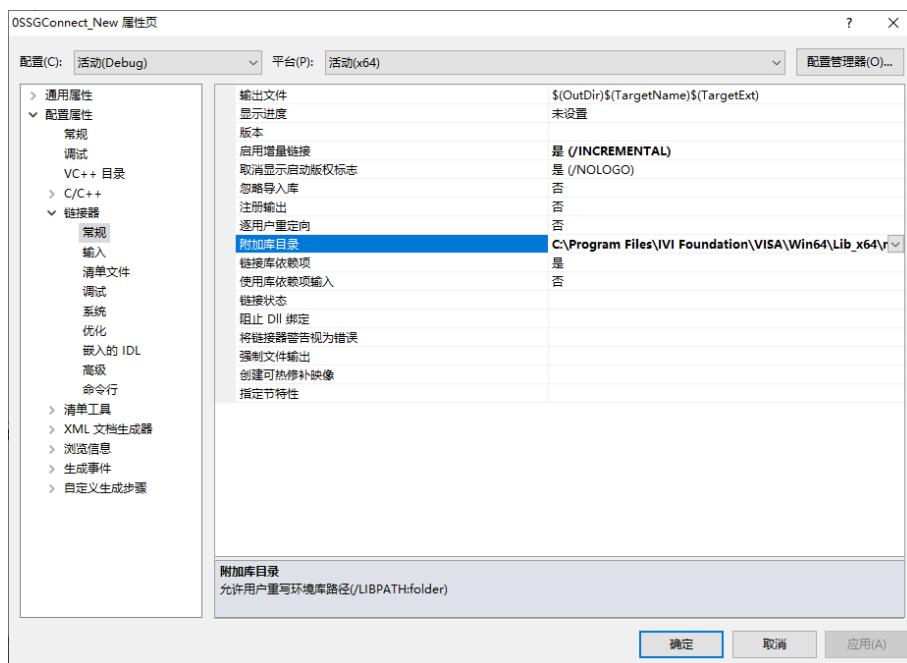

```
#include "visa.h"  
#pragma comment(lib,"visa32.lib")
```

- (2) Automatic:

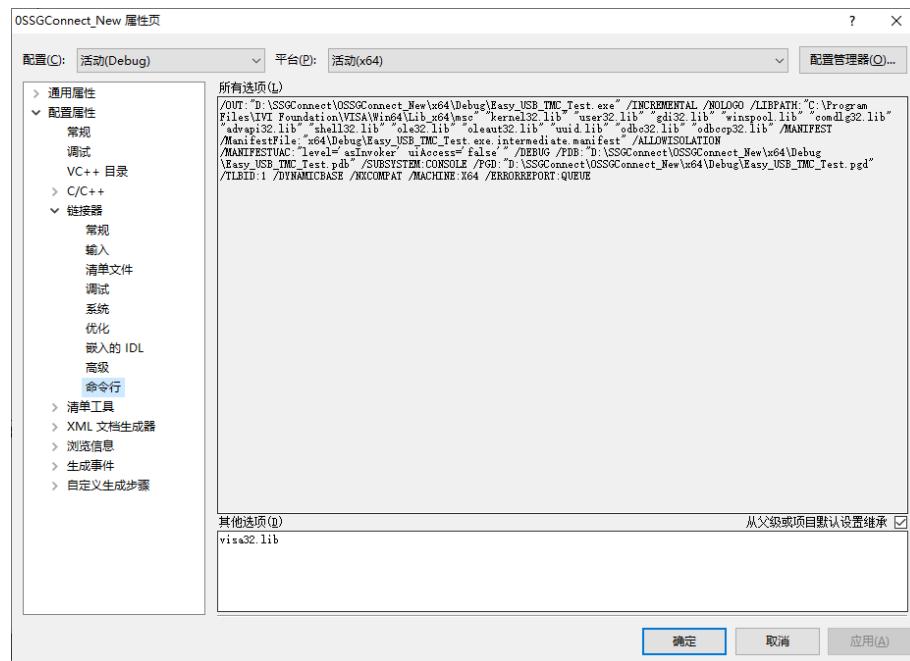

Set the include directory for header files. The default installation path of NI-VISA header files is “C:\Program Files\IVI Foundation\VISA\Win64\Include”. Fill in the header file installation path in Project --- Properties --- C/C++ --- General --- Additional Include Directories, as shown below:

Set the include directory of library files. The default installation path of NI-VISA library files is "C:\Program Files\IVI Foundation\VISA\Win64\Lib\_x64\msc". Fill in the library file installation path in Project --- Properties --- Linker --- General --- Additional library directory, as shown below:

Set up library files. Fill in the library file name in Project --- Properties --- Linker --- Command Line --- Additional Options: visa32.lib, as shown below:

Finally, reference the header file in the project .cpp file:

```
#include <visa.h>
```

### 3. Add code

#### (1) USBTMC access code

Write a function Usbtmc\_test:

```
int Usbtmc_test()
{
    /* This code demonstrates sending synchronous read & write commands */
    /* to an USB Test & Measurement Class (USBTMC) instrument using */
    /* NI-VISA          */
    /* The example writes the "*IDN?\n" string to all the USBTMC */
    /* devices connected to the system and attempts to read back */
    /* results using the write and read functions.      */
    /* The general flow of the code is */
    /* Open Resource Manager          */
    /* Open VISA Session to an Instrument          */
    /* Write the Identification Query Using viPrintf          */
    /* Try to Read a Response With viScarf          */
    /* Close the VISA Session   */
    //*****
    ViSession defaultRM;
    ViSession instr;
    ViUInt32 numInstrs;
    ViFindList findList;
    ViStatus status;
    char instrResourceString[VI_FIND_BUflen];
```

```
unsigned char buffer[100];
int i;
/** First we must call viOpenDefaultRM to get the manager
 * handle. We will store this handle in defaultRM.*/
status = viOpenDefaultRM (&defaultRM);
if (status<VI_SUCCESS)
{
    printf ("Could not open a session to the VISA Resource Manager!\n");
    return     status;
}

/* Find all the USB TMC VISA resources in our system and store the number of resources in the system in
numInstrs.*/
status = viFindRsrc (defaultRM, "USB?*INSTR", &findList, &numInstrs, instrResourceString);
if (status<VI_SUCCESS)
{
    printf ("An error occurred while finding resources.\nPress 'Enter' to continue.");
    fflush(stdin);
    getchar();
    viClose (defaultRM);
    return     status;
}

/** Now we will open VISA sessions to all USB TMC instruments.
 * We must use the handle from viOpenDefaultRM and we must
 * also use a string that indicates which instrument to open. This
 * is called the instrument descriptor. The format for this string
 * can be found in the function panel by right clicking on the
 * descriptor parameter. After opening a session to the
 * device, we will get a handle to the instrument which we
 * will use in later VISA functions. The AccessMode and Timeout
 * parameters in this function are reserved for future
 * functionality. These two parameters are given the value VI_NULL.*/
for (i=0; i<int(numInstrs); i++)
{
    if (i> 0)
    {
        viFindNext (findList, instrResourceString);
    }
    status = viOpen (defaultRM, instrResourceString, VI_NULL, VI_NULL, &instr);

## 4.1.2 VB Example

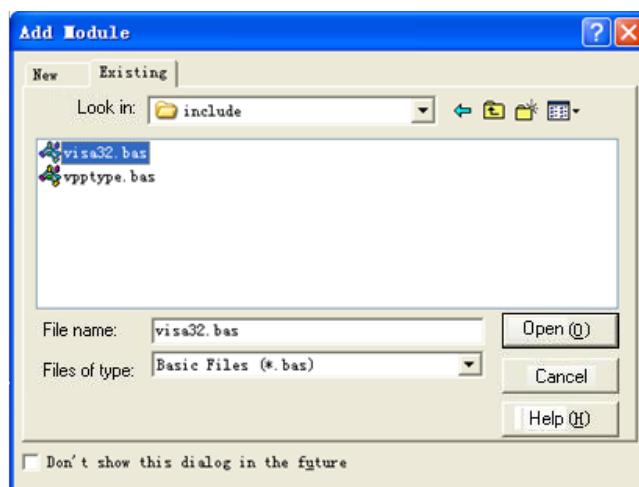

**System environment:** Windows 7

**Programming software:** Microsoft Visual Basic 6.0

**Example content:** Use NI-VISA to access and control the device through USBTMC or TCP/IP and perform read and write operations.

Please follow below steps to complete the example:

1. Open Visual Basic and build a standard application program project (standard EXE).
2. Set up the project environment to use the NI-VISA library. Click the Existing tag of Project >> Add Existing Item, search for the visa32.bas file in the include folder under the NI-VISA installation path and add the file. This will enable VISA functions and VISA data types to be used in the program.

3. Add code

- (1) USBTMC access code

Write a function Usbtmc\_test:

```
Private Function Usbtmc_test() As Long
    ' This code demonstrates sending synchronous read & write commands
    ' to an USB Test & Measurement Class (USBTMC) instrument using
    ' NI-VISA
    ' The example writes the "*IDN?\n" string to all the USBTMC
    ' devices connected to the system and attempts to read back
    ' results using the write and read functions.
    ' The general flow of the code is
    ' Open Resource Manager
    ' Open VISA Session to an Instrument
    ' Write the Identification Query Using viWrite
    ' Try to Read a Response With viRead
    ' Close the VISA Session
```

```

Const MAX_CNT = 200

Dim defaultRM As Long
Dim instrsesn As Long
Dim numInstrs As Long
Dim findList As Long
Dim retCount As Long

Dim status As Long
Dim instrResourceString As String * VI_FIND_BUflen
Dim Buffer As String * MAX_CNT
Dim i As Integer

' First we must call viOpenDefaultRM to get the manager
' handle. We will store this handle in defaultRM.
status = viOpenDefaultRM(defaultRM)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Could not open a session to the VISA Resource Manager!"
    Usbtmc_test = status
    Exit Function
End If

' Find all the USB TMC VISA resources in our system and store the
' number of resources in the system in numInstrs.
status = viFindRsrc(defaultRM, "USB?*INSTR", findList, numInstrs, instrResourceString)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "An error occurred while finding resources."
    viClose(defaultRM)
    Usbtmc_test = status
    Exit Function
End If

' Now we will open VISA sessions to all USB TMC instruments.
' We must use the handle from viOpenDefaultRM and we must
' also use a string that indicates which instrument to open. This
' is called the instrument descriptor. The format for this string
' can be found in the function panel by right clicking on the
' descriptor parameter. After opening a session to the
' device, we will get a handle to the instrument which we
' will use in later VISA functions. The AccessMode and Timeout
' parameters in this function are reserved for future
' functionality. These two parameters are given the value VI_NULL.

For i = 0 To numInstrs
    If (i > 0) Then
        status = viFindNext(findList, instrResourceString)
    End If

```

```
status = viOpen(defaultRM, instrResourceString, VI_NULL, VI_NULL, instrsesn)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Cannot open a session to the device " + CStr(i + 1)
    GoTo NextFind
End If

' At this point we now have a session open to the USB TMC instrument.
' We will now use the viWrite function to send the device the string "*IDN?",
' asking for the device's identification.
status = viWrite(instrsesn, "*IDN?", 5, retCount)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Error writing to the device."
    status = viClose(instrsesn)
    GoTo NextFind
End If

' Now we will attempt to read back a response from the device to
' the identification query that was sent. We will use the viRead
' function to acquire the data.
' After the data has been read the response is displayed.
status = viRead(instrsesn, Buffer, MAX_CNT, retCount)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Error reading a response from the device." + CStr(i + 1)
Else
    resultTxt.Text = "read from device: " + CStr(i + 1) + " " + Buffer
End If
status = viClose(instrsesn)

Next i

' Now we will close the session to the instrument using
' viClose. This operation frees all system resources.
status = viClose(defaultRM)
Usbtmc_test = 0

End Function
```

## (2) TCP/IP access code

Write a function TCP\_IP\_Test:

```
Private Function TCP_IP_Test(ByVal ip As String) As Long
    Dim outputBuffer As String * VI_FIND_BUflen
    Dim defaultRM As Long
    Dim instrsesn As Long
    Dim status As Long
```

Dim count As Long

```
' First we will need to open the default resource manager.
status = viOpenDefaultRM(defaultRM)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Could not open a session to the VISA Resource Manager!"
    TCP_IP_Test = status
    Exit Function
End If

' Now we will open a session via TCP/IP device
status = viOpen(defaultRM, "TCPIP0::" + ip + "::INSTR", VI_LOAD_CONFIG, VI_NULL, instrsesn)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "An error occurred opening the session"
    viClose(defaultRM)
    TCP_IP_Test = status
    Exit Function
End If

status = viWrite(instrsesn, "*IDN?", 5, count)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Error writing to the device."
End If
status = viRead(instrsesn, outputBuffer, VI_FIND_BUflen, count)
If (status < VI_SUCCESS) Then
    resultTxt.Text = "Error reading a response from the device." + CStr(i + 1)
Else
    resultTxt.Text = "read from device:" + outputBuffer
End If
status = viClose(instrsesn)
status = viClose(defaultRM)
TCP_IP_Test = 0

End Function
```

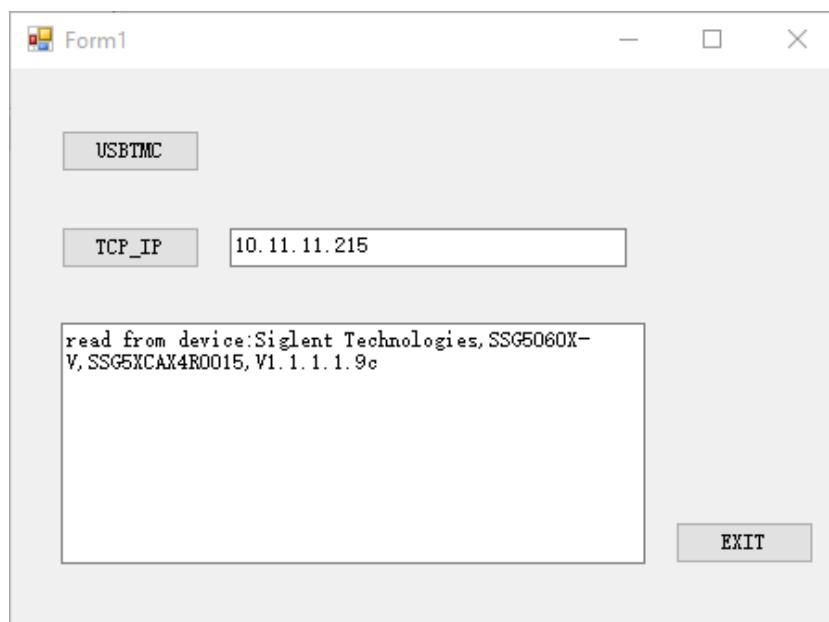

### (3) Button control code:

```
Private Sub exitBtn_Click()
    End
End Sub

Private Sub tcpipBtn_Click()
    Dim stat As Long
    stat = TCP_IP_Test(ipTxt.Text)
    If (stat < VI_SUCCESS) Then
        resultTxt.Text = Hex(stat)
    End If
```

```
End Sub  
Private Sub usbBtn_Click()  
    Dim stat As Long  
    stat = Usbtmc_test  
    If (stat < VI_SUCCESS) Then  
        resultTxt.Text = Hex(stat)  
    End If  
End Sub
```

### 4.1.3 MATLAB Example

**System environment:** Windows 7

**Programming software:** MATLAB R2013a

**Example content:** Use NI-VISA to access and control the device through UBTMC or TCP/IP and perform read and write operations.

Please follow below steps to complete the example:

1. Open MATLAB and modify the current directory. In this example, change the current directory to D:\USBTMC\_TCPIP\_Demo.
2. Click File>>New>>Script in the MATLAB interface to create an empty M document.
3. Add code

(1) UBTMC access code

Write a function Usbtmc\_test:

```
function USBTMC_test()
% This code demonstrates sending synchronous read & write commands
% to an USB Test & Measurement Class (UBTMC) instrument using
% NI-VISA

%Create a VISA-USB object connected to a USB instrument
vu = visa('ni','USB0::0xF4EC::0x1501::0123456789::INSTR');

%Open the VISA object created
fopen(vu);

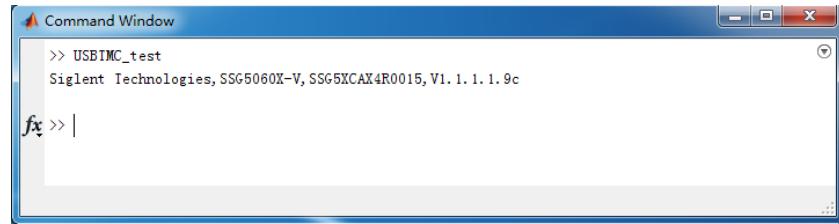

%Send the string "*IDN?", asking for the device's identification.
fprintf(vu, "*IDN?");

%Request the data
outputbuffer = fscanf(vu);
disp(outputbuffer);

%Close the VISA object
fclose(vu);
delete(vu);
clear vu;

end
```

**The running result:**

## (2) TCP/IP access code

Write a function TCP\_IP\_Test:

```
function TCP_IP_test()
% This code demonstrates sending synchronous read & write commands
% to an TCP/IP instrument using NI-VISA

%Create a VISA-TCPIP object connected to an instrument
%configured with IP address.
vt = visa('ni','[TCP|PO::10.11.11.215']');

%Open the VISA object created
fopen(vt);

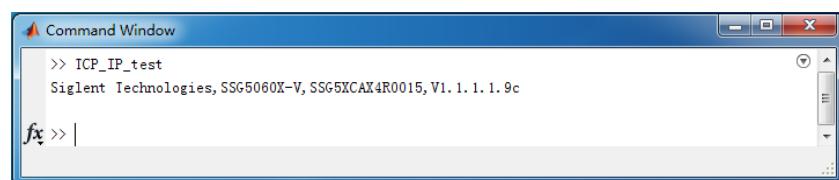

%Send the string "*IDN?", asking for the device's identification.
fprintf(vt,'*IDN?');

%Request the data
outputbuffer = fscanf(vt);
disp(outputbuffer);

%Close the VISA object
fclose(vt);
delete(vt);
clear vt;

end
```

#### 4.1.4 LabVIEW Example

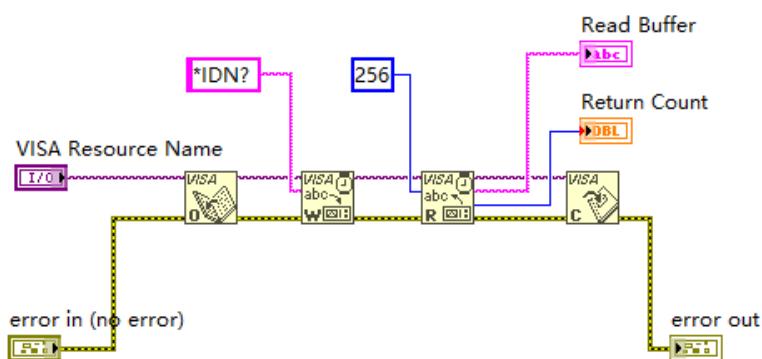

**System environment:** Windows 7

**Programming software:** LabVIEW 2011

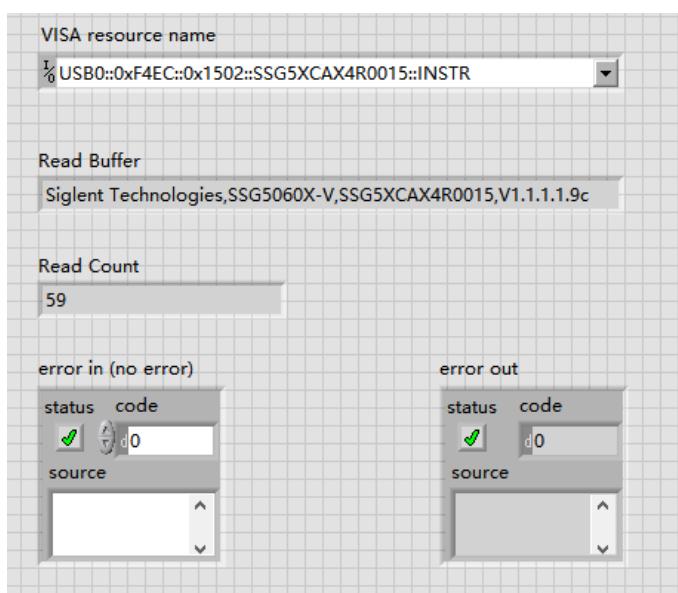

**Example content:** Use NI-VISA to access and control the device through USBTMC or TCP/IP and perform read and write operations.

Please follow below steps to complete the example:

1. Open LabVIEW and create a VI file.
2. Add controls. Right-click the front panel interface, select and add VISA resource name, error input, error out and some indicators in the controls column.
3. Open the block diagram interface. Right-click the VISA resource name and select from the shortcut menu of the VISA palette to add the following functions: VISA Write, VISA Read, VISA Open and VISA Close.
4. Connect them as shown in the figure below:

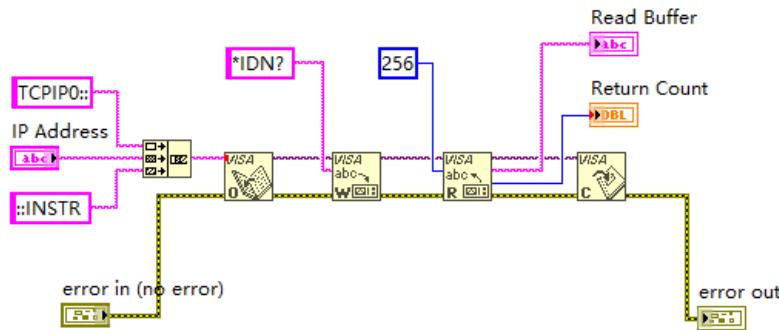

5. Select the device resource from the VISA resource name list box and run the program.

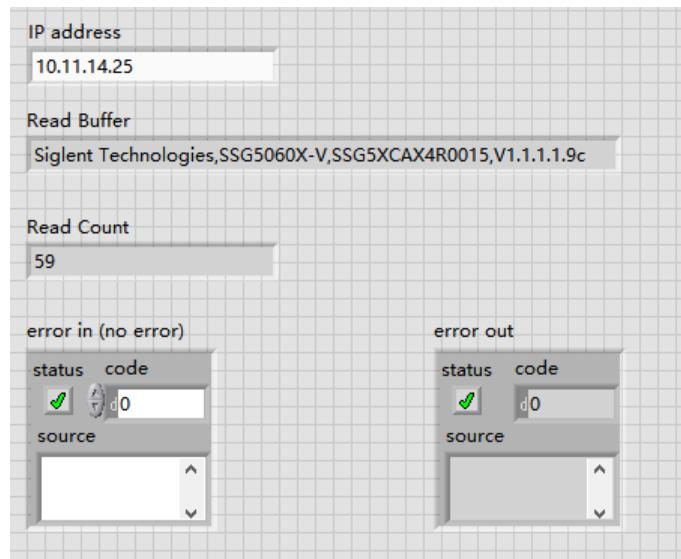

In this example, the VI opens a VISA session to the USBTMC device, writes a command to the device, and then reads back the response. In this example, the specific command sent is a device ID query. Please check the device command set with your device manufacturer. After all communication is complete, the VI closes the VISA session.

Communicating with the device over TCP/IP is similar to USBTMC. However, you need to change the VISA write and VISA read functions to synchronize the I/O. LabVIEW's default is asynchronous I/O. Right-click the node and select Synchronous I/O Mode>>Sync from the shortcut menu to write or read synchronized data.

1. Connect them as shown in the figure below:

2. Enter the IP address and run the program:

## 4.2 Socket Examples

The Windows operating system itself supports Sockets communication, and this communication method is also relatively simple. It should be noted that "\n" (newline character) needs to be added to the end of the SCPI command string.

### 4.2.1 Python Example

Python is an interpreted programming language that allows you to work quickly and is very portable. Python has an underlying network module that provides access to the Socket interface, port 5025. Python scripts can be written for the Socket interface to perform various test and measurement tasks.

**System environment:** Windows 10, 64-bit operating system

**Programming software:** Python v3.6.5

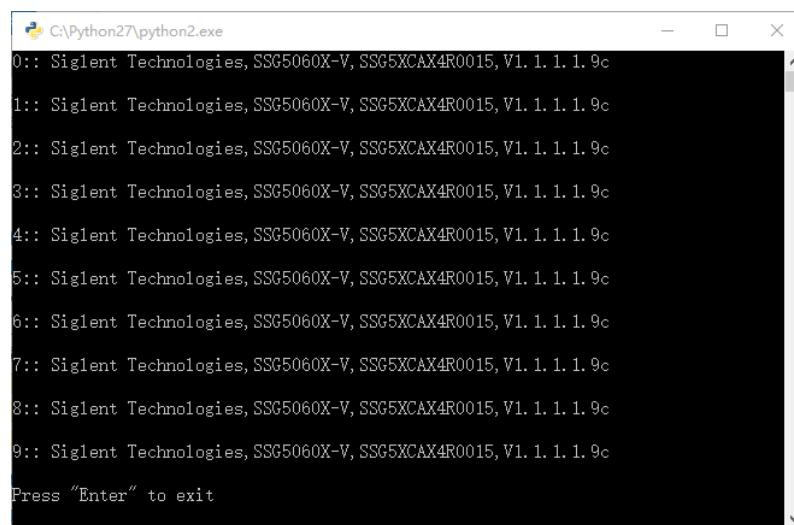

**Example content:** Open a Socket, send a SCPI query, then close the Socket, loop ten times.

Below is the code of the script:

```
#!/usr/bin/env python
#-*- coding:utf-8 -*-
#-----
# The short script is an example that open a socket, sends a query,
# print the return message and closes the socket.
#-----
import socket # for sockets
import sys # for exit
import time # for sleep
#-----
remote_ip = "10.11.22.27" # should match the instrument's IP address
port = 5025 # the port number of the instrument service

def SocketConnect():
    try:
        #create an AF_INET, STREAM socket (TCP)
        s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
    except socket.error:
        input ('Failed to create socket. \nPress "Enter" to exit: ')
        sys.exit()
    try:
        #Connect to remote server
        s.connect((remote_ip , port))
```

```
except socket.error:  
    input('Failed to connect to ip %s!\nPress "Enter" to exit: ' % remote_ip)  
    s.close()  
    sys.exit()  
return s  
  
def SocketQuery(Sock, cmd):  
    try :  
        #Send cmd string  
        Sock.sendall(cmd)  
        time.sleep(1)  
    except socket.error:  
        #Send failed  
        input('Send failed!\nPress "Enter" to exit: ')  
        SocketClose(Sock)  
        sys.exit()  
    reply = Sock.recv(4096)  
    reply = reply.decode()  
    return reply  
  
def SocketClose(Sock):  
    #close the socket  
    Sock.close()  
    time.sleep(.300)  
  
def main():  
    # Body: send the SCPI commands *IDN? 10 times and print the return message  
    s = SocketConnect()  
  
    count = 0  
    for i in range(10):  
        qStr = SocketQuery(s, b'*IDN?\n')  
        print (str(count) + ":: " + qStr)  
        count = count + 1  
    SocketClose(s)  
    input('Press "Enter" to exit')  
  
if __name__ == '__main__':  
    main()
